Tesla Off-Peak Charging Feature

Designing a smarter and more user friendly home charging experience

Introduction

Goal

Enable Tesla owners to charge effortlessly at the lowest cost and with **full confidence**, by automating off-peak charging and providing **clear savings insights** through the Tesla companion app

Reasoning

Right now, owners have to know their own off-peak hours and set them manually, which can be confusing or unreliable. The app does not show how much money or energy they are saving, so many people are unsure if scheduling is worth it. A smarter system would reduce hassle, build trust, and make charging feel effortless while supporting Tesla's mission of making EV adoption easier.

Vision

A Tesla app where home charging feels **automatic and stress-free**. The system adapts to utility rates, user preferences, and sustainability goals. Drivers just plug in, and Tesla takes care of the rest by saving money, reducing grid strain, and making the energy ecosystem smarter for everyone.

Current Problems

1

Lack of Support

The Tesla App current only lets users set charging times manually, but does not suggest cheapest off-peak times or show savings from off-peak charging

2

Reliance on User

To charge during off-peak times, the onus is on the user to find out their own off-peak hours, schedule it on the app, and calculate savings

3

Confusing UI

Users have reported frustrations with the scheduling UI, confusion between the start time and end time, and overall unreliability with the feature

User Testimonials

Tesla manual confirms there is a “finish by departure time” feature for reducing energy cost — but users still report ambiguity in savings and automation

“Why is scheduled charging as complicated as it is? if I don't add a start time then charging starts immediately ... I have to do the backwards math ... and hope the schedule sticks until the next day.”

“My schedule keeps getting turned off, charging begins immediately upon plug in instead of my 2 AM setting.”

User Personas

Everyday Downtown Driver

25-35 years old. Works long hours with a long commute. Consistently charges his Tesla every day, but forgets to schedule it around off-peak hours to maximize savings. Seeks **automation**

Value Focused Owner

35-60 years old. Have lots of different trips a day with different route lengths. Demand a lot more from the battery and charge it more often. Seek to **save money** and **know how much they saved** to budget

Green User

25-45 years old. Bought a Tesla for their eco-friendliness first. Values the environment and reducing their carbon footprint. Seeks to charge their Tesla when the grid is the **cleanest** to reduce harm to the environment

All 3 of these personas share the following needs

Automation

Reliability

Transparency

Control

Key Takeaway

Focus on delivering all 4 shared needs in an easy-to-use UI

Current vs. Proposed Flow

To schedule charging during off-peak hours and maximize savings, here is what Tesla owners must do currently

Pain Points:

Manual Effort

No Savings Estimate

Occasional Faliure

To address the pain points, here is a new proposed user flow to charge during off-peak hours

In this flow, the user only needs to confirm or override

To address the user pain points, I propose 3 views, including one card prompt in the home screen and 2 detail screens

View 1

Home Screen

Initial Recommendation

View 2

Savings Screen

See how much you saved

View 3

Preferences Screen

Adjust settings

View 1

View 2

View 3

Impact & Next Steps

With the adoption of this feature, we should see the following benefits across these stakeholders

User Value

Saves Tesla drivers around **40%** on energy bills

Business Value

Increases Tesla brand loyalty and app stickiness

Social Value

Encourages off-peak charging, supporting grid sustainability

To ensure this feature continues meeting user needs and is validated in a proper manner

Prototype

Build interactive mockups for Tesla app & in-car UI to test interactions

Measure

Track adoption, average savings, and reliability through app stats and user discourse

Iterate

Refine flows based on user feedback and edge cases (schedule reliability, savings clarity, etc...)
